Credit Name:

Assignment Name: PrimeNumber

How has your program changed from planning to coding to now? Please explain?

At first i thoughti i could just call the method when i wanted to check if it was prime but i added some more things like automatically making it false if it was 1 or any number under 1, i also didnt think of the squareroot for primes but i was watching a video about prime numbers at home and they started talking about square roots and how you dont have to do all that so i thought itd way easier for me if i included that in my code aswell.
